

WHAT IS CLAIMED IS:

1. Centering member for a plane tool comprising means shaped for enabling permanent fastening of the member into at least one aperture spared in one of the sides of the plane tool without the addition of any mechanical fastening element and without the addition of any material or adhesive element.
2. The member of claim 1, wherein the means comprises a base; at least one boss projecting from the base, the base comprising a trunk, a head on the trunk and a gripping means on the head for directly connecting with the plane tool.
3. The member of claim 2, further comprising a groove located at a joint between the trunk and the head, the groove being of a size to give the head a mechanical elasticity as compared to the remainder of the boss.
4. The member of claim 3, wherein the head is of such size relative to the thickness of the tool that when the head inserted into the aperture in the tool, the head is of such a height that the head is countersunk in the thickness of the plane tool in the head or the head emerges only partially out of one of the sides of the tool.
5. The member of claim 4, wherein the head comprises at least one projection sized and shaped to exert friction moving towards the outside of the plane tool, in the plan view direction of the tool.
6. The member of claim 3, wherein the head inserted into the aperture in the tool is of such a height that the head emerges completely out of one of the sides of the plane tool.
7. The member of claim 6, wherein the head comprises at least one projection which ends at an edge supported against one of the sides of the plane tool.

8. The member of claim 4, wherein the trunk of the boss is shaped and placed such that it is inserted without any shift into the aperture.

9. The member of claim 2, wherein the boss is bored with a horizontal hole.

10. The member of claim 2, wherein the trunk is a right parallelepiped and the head is trapezoidal in shape.
